IMovies – Movie Ticket Booking System Documentation and Demo

User guide, installation, presentation and conclusion

Project documentation based on the uploaded bookMyShow-main source ZIP

Prepared: 31 October 2026

Documentation and Demo

7.1 Project abstract

IMovies is a full-stack movie ticket booking web application. It combines a React-based user interface with an Express API and MongoDB database. The system organizes movie, theatre, show, user and booking information and provides workflows for movie discovery, seat selection, booking records and administration.

7.2 Installation guide

Install Node.js and configure MongoDB. In server/.env set MONGO_URL and JWT_SECRET (and Stripe configuration only if required). Install and start the server from the server directory. Install and start the React client from the client directory. Configure backend CORS for localhost:3000 and ensure the frontend API base URL points to localhost:8082.

7.3 User manual

- Open the application in a browser.
- Register an account or log in.
- Browse the movie catalogue and choose a movie.
- Select a theatre and showtime.
- Choose available seats and continue through the booking flow.
- Review the confirmation and check booking history.

7.4 Administrator manual

Log in with an authorized administrator account. Open the admin area to manage movie records and theatre/show information. The source includes admin pages and protected API routes; use valid administrator credentials supplied by the project owner or create an authorized account through a controlled setup process.

7.5 Suggested 3–5 minute demo script

- 0:00–0:25: Introduce IMovies and its technology stack.
- 0:25–1:00: Show registration/login and home page.
- 1:00–1:45: Browse movies and open a movie detail page.
- 1:45–2:45: Select theatre/show and demonstrate seat selection.
- 2:45–3:30: Show booking confirmation and booking history if successful.
- 3:30–4:15: Show admin movie/theatre management.
- 4:15–4:45: Briefly explain React, Express, MongoDB and JWT architecture.

7.6 Conclusion

The project demonstrates a modular full-stack web application for cinema discovery and booking. It brings together client-side routing/state, REST APIs, authentication and document-based persistence. Its suitability for a production environment depends on further security, concurrency, payment and operational testing.

7.7 Future enhancements

- Atomic seat reservation and transaction-safe booking.
- Verified payment flow, refunds and payment reconciliation.
- Email/SMS tickets and QR-code validation.

- Configurable screen layouts and seat categories.
- Search, filters, ratings and recommendations.
- Automated unit, integration and load testing.
- Deployment hardening, monitoring, backups and audit logs.

7.8 References

Uploaded bookMyShow-main README and source tree; official React, Node.js, Express, MongoDB/Mongoose and JWT documentation. Add access dates and exact URLs required by your institution's citation format.

Accuracy note: This document describes the code and README found in the supplied ZIP. Items marked as recommendations or proposed tests are not claims that they have already been implemented or passed. Confirm all workflows on your laptop before submission.
